SPRING 2020 PRODUCTS

## CREAMER DUAL CLASS A PENTODE PREAMPLIFIER

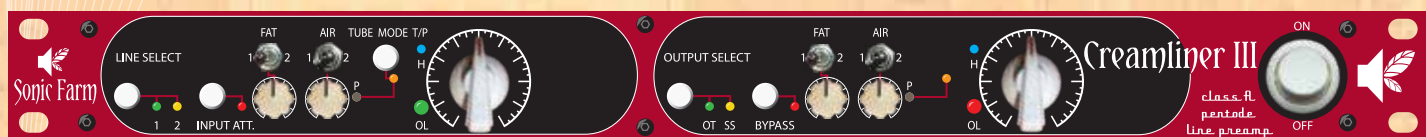

**Creamer Plus**, our flagship product, has quickly become the "go-to" preamp for the discriminating engineers and producers!

## BERLINER DUAL CLASS A PENTODE PREAMPLIFIER

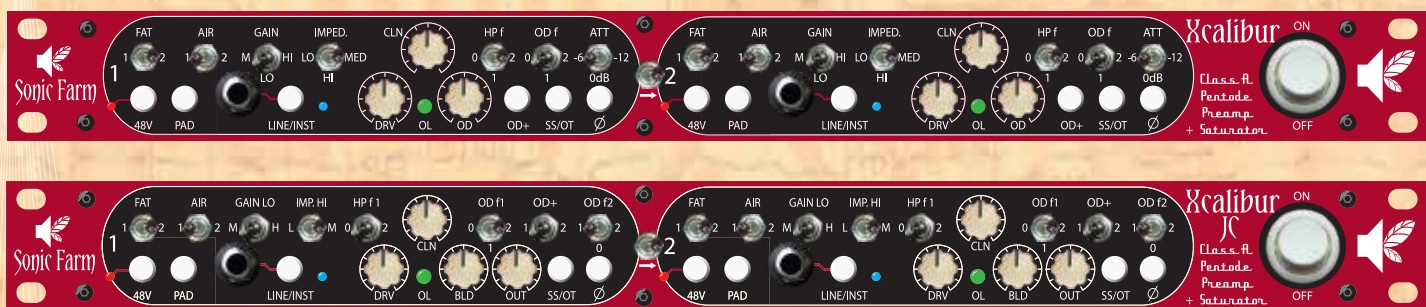

**Berliner** is a tube preamp inspired by the legendary Telefunken V76, but its many improvements take it to the next level! It uses current production EF86 pentodes to allow easy tube replacement. Thanks to an advanced bias circuit, it was possible to add both instrument and line inputs while keeping the stunning realism of the vintage Telefunken preamp.

## CREAMLINER DUAL CLASS A PENTODE LINE PREAMP

**Creamliner** is a stereo line signal conditioner. It "glues" in-the-box mixes and warms up the sound of digital PA boards by running the signal through a pentode and a pair of transformers. **Creamliner** became an important part of many mastering studios and leading FOH engineers' rigs who rely on it's smoothing effect to polish the stage sound for the demanding artists.

## XCALIBUR DUAL PENTODE SATURATION PREAMP

**Xcalibur** and **Xcalibur JC (New!)** are pentode saturation preamps with multiple personalities: from pristine transparent and sparkly to harmonics rich heavy overdrive capable of some serious sonic damage! This is what the "Fab Four" should have had back in the days when they recorded the White Album! If you want to elevate your production to the next level, then **Xcalibur** may just be the ticket! Pre-overdrive filter and blend control help dial in just the right amount of "dirt". **Xcalibur** also has all the features found on our other tube preamps enabling it to excel at any studio application. The **JC** version (new, designed in collaboration with Joe Chiccarelli) adds a 3-way post-drive low pass filter and a master level control for even more tonal options. **Xcaliburs** run on a super high, 320VDC plate voltage, which gives them an unbelievably rich clean and also saturated tones.

## 2DI4 PENTODE DIRECT BOX

**2di4** is a dream come true for bass players, as well as guitarists who record direct and use an amp simultaneously. And because it has both line and mic level balanced outputs, which can be used simultaneously, it can drive a variety of inputs. As with the Creamer, a single, 280V powered pentode is the only gain stage. The high and low frequency boost circuits use high quality capacitors and inductors to impart fatness or top end to your signal in a very musical way. A buffered amp output enables a long cable connection with your amp, without a high end roll-off. A special DI transformer brings the output down to mic level, to drive PA consoles. Another balanced, line level output is also there for direct recording. Our users say this is the absolute state of the art in direct boxes. Whoever has tried one, never goes back.

## TANTRA STUDIO BASS PREAMP

2018

**Tantra**, a hybrid bass preamp with an optional 1000 or 2500W (**New!**) Class D power module, sets the new standard for high end analog bass amplification. It features a pentode front end, a 2-stage tube overdrive section, 5 band EQ, a dual time constant compressor, a harmonics generator, an FX loop, and balanced line and DI outputs. Dial in any kind of a bass tone and roar!

## SILKWORM AND SILK ROAD SOLID STATE PREAMPS

2015

**Silkworm** and **Silk Road** are high end solid state preamps, featuring discrete gain stages with hand matched transistors and dual stage servo loops for full DC operation, yielding a deep, phase-shift free low end response.

**Silkworm** is a series 500 compatible module, whereas **Silk Road** has an integrated dual 24V power supply giving it extended headroom that series 500 units cannot reach. Additionally, a 3-position high pass filter helps remove unwanted low end mud. Both units share an amazing tonal flexibility that ranges from vintage preamp emulation all the way to modern, pristine realism, and as a result excel on everything thrown at them.

## Sonic Farm Silk Road

## STAR TREQ DUAL PENTODE EQ

**Star Treq (New!)** is a tube EQ with a hybrid topology: pentodes supply the main bulk of gain needed to provide sweet sounding equalization and a precise yet smooth action. Transistors are used as buffers to drive the output transformer and subsequent units in the chain. All 5 filter boards are 100% passive and use real inductors and capacitors to achieve bell shaped curves.

First and last band can also be switched to shelving mode. The bandwidth can be adjusted between .2 and 9. Twelve frequency steps using rotary switches. Gain and Shape pots are detented. This EQ has the highest headroom in the industry thanks to dual 150V rails, meaning both tubes and transistors effectively run on 300VDC. Extremely flexible, use for tracking, mastering, anything in the studio. Available this fall.
